**31.8% did not undergo intervention, despite NYHA class III/IV symptoms**

**Aims** To identify the characteristics, treatment, and outcomes of contemporary patients with valvular heart disease (VHD) in Europe, and to evaluate adherence to guidelines. **Methods and results** The Euro Heart Survey on VHD was conducted from April to July 2001 in 92 centres from 25 countries; it included prospectively 5001 adults with symptoms or signs of aortic regurgitation (AR), aortic stenosis (AS), or previous valve intervention. VHD was native in 71.3% of patients and 28.7% had had a previous intervention. Mean age was 64.14 years. Degenerative aetiologies were the most frequent in aortic VHD and mitral regurgitation while most cases of mitral stenosis were of rheumatic origin.

Coronary angiography was used in 80.2% of patients before intervention. Of the 1269 patients who underwent intervention, anaesthetic management was performed in 94.0% of aortic VHD, percutaneous aortic valve in 12.8% of aortic stenosis, and valve repair in 46.5% of mitral regurgitation; 71.7% of patients had at least one associated procedure. Of patients with severe, symptomatic, single VHD, 31.8% did not undergo intervention, most frequently because of comorbidity. In multivariate patients, association with guidelines (logistic regression) was 1.2 and 1.5, respectively. Operative mortality was <1% for single VHD. **Conclusions** This survey provides unique contemporary data on characteristics and treatment of patients with VHD. Adherence to guidelines is globally satisfactory as regards diagnosis and intervention.

**Consumer Inquiries:** 888-INFO-FDA

### FDA expands approved use of Sapien artificial heart valve

The U.S. Food and Drug Administration today expanded the approved indication for the Sapien Transcatheter Heart Valve (THV) to include patients with aortic valve stenosis who are eligible for surgery, but who are at high risk for serious surgical complications or death.

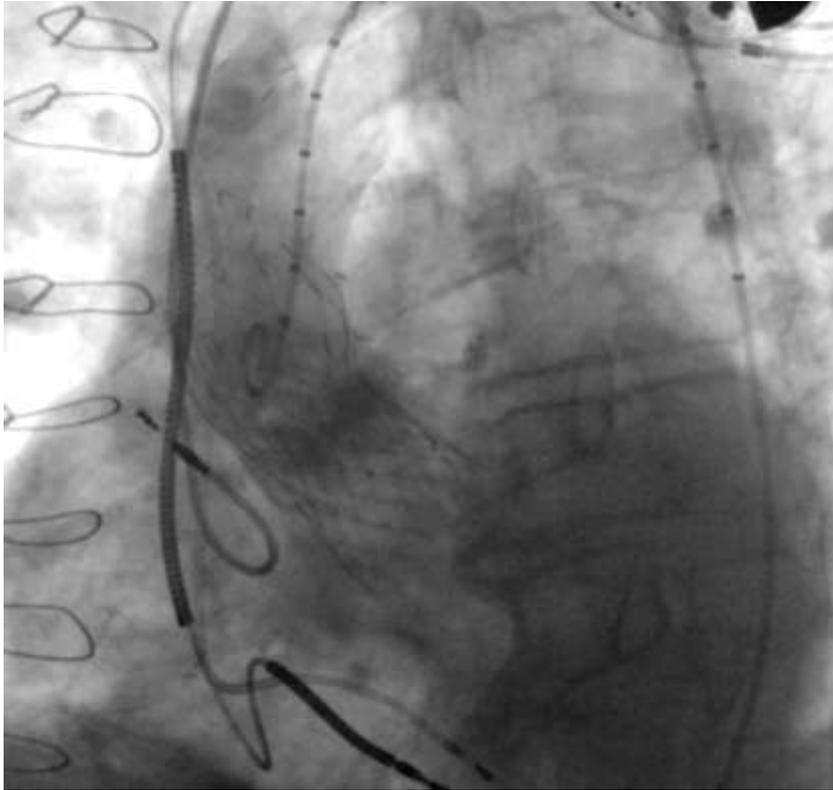

The FDA first approved the Sapien THV in 2011 for patients with inoperable aortic valve stenosis, a progressive, age-related disease. Calcium deposits on the aortic valve that cause it to narrow are a common cause of aortic valve stenosis. As the heart works harder to pump enough blood through the smaller opening, it eventually weakens. Aortic valve stenosis can lead to fainting, chest pain, heart failure, irregular heart rhythms (arrhythmias), or cardiac arrest.

Those with severe aortic valve stenosis must have a heart valve replacement to restore normal blood flow. Patients who are in good enough health to tolerate surgery usually undergo open-chest, open-heart surgery or a minimally invasive surgery, in which surgeons gain access to the heart through an incision between the ribs.

# Off label TAVI use??

TAVI during the acute phase of MI

Toutouzas K, Michelongona A, Synetos A, Latsios G, Drakopoulou M, Stefanadis C., Int J Cardiol. 2011 Nov 3;152(3):398-400. Epub 2011 Sep 15.

# Off label TAVI use??

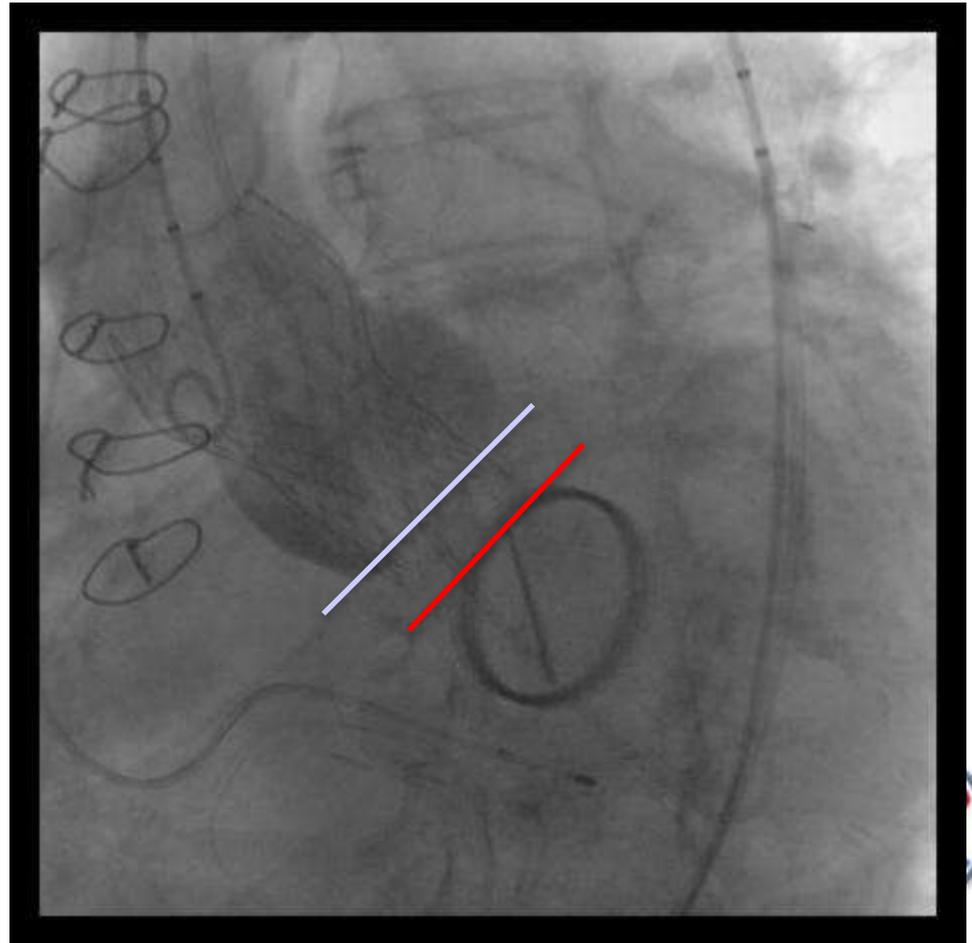

## TAVI in a patient with prosthetic mitral valve

Implantation **level** according to non-coronary cusp pigtail

**Metallic mitral valve**  
**LVOT adjunction level**

The CoreValve prosthesis is in optimal position, in respect

1. to the native valve (~6 mm deep)
2. to the metallic mitral valve (not interfering with each other)
